

Value AddOn Solution Customs Integration GE

The processing and evaluation of customs-relevant transaction data are an integral part of the core processes of international companies and therefore do not make sense to manage outside of an ERP system as an additional solution and are therefore not available on the market as an independent solution. Our solution can be parameterized so that future customs requirements and/or changing requirements per federal state (Germany) can be realized without significant development work. The FSS Value AddOn Solution is already in use in German enterprises and so far has been able to fulfill every requirement arising from customs revisions and audits.

Requirements and functionality

Customs requirements are very complex and require JD Edwards EnterpriseOne to make various adjustments to existing applications as well as to build new processes, plausibility structures and audits. An implementation using the JD Edwards EnterpriseOne standard cannot be realized. The objective of introducing the FSS Value AddOn Solution is to map the customs processes within JD Edwards EnterpriseOne based on newly created applications and versions. This includes the creation of new data entities (Data Dictionary), the development of tables, masks and UDC lists

as well as the creation of the customs register file and customs evaluation.

Customer benefits / value added

By processing customs-relevant processes without peripheral systems, friction losses due to interfaces are eliminated. Any changes in relevant master or transaction data are immediately updated and traceable in all affected tables. Customs-related reports and evaluations are always based on the latest available data and are not generated with time delays. Workflows and processes are easier to automate resulting in the reduction of manual efforts of the responsible clerks. Each data record

from sales, manufacturing or purchasing orders can be automatically transferred to

the customs register by means of triggers.
